What is a Template Selector?

- Template Selectors define how inbound XML data is processed, and broken down into transactions that are used to create documents.
- Typically, the inbound XML data file will contain many transactions. A Simple Template Selector will generate one document for each transaction.
- Each template selector specifies one template, one channel, and optionally one language, idiom, jurisdiction, or brand.
- To use a particular template selector it must be specified by the external calling system when they supply the XML data and make the document generation request.

What is a Template Selector?

What is a Scriptable Template Selector?

- A Scriptable Template Selector allows for more complex logic
- It is written in JavaScript
- It is what we will use to generate multiple copies
